Isovibe SX for New 2014 Yamaha/Arctic Cat Procross/Proclimbs with stock aluminum riser block. Fits all Yamaha with the Arctic Cat chassis.

New Isovibe SX model designed for snowcross racers and aggressive trail/standup riders. SX bushing design absorbs vibration just like the original Isovibe but takes shock absorption to a new level. The new design absorbs shock in the forward and rearward direction just like the original design but now absorbs shock in the vertical and side to side direction.

The main goal for this design was to absorb the shock normally transferred to your wrists, shoulders and arms when landing jumps or hitting hard bumps with one ski. If you've even landed a jump wrong on one ski you've experienced the side to side impact to your wrists that sometimes rips the bars out of your hands. This new Isovibe SX will absorb this impact and keep you in control.

The Isovibe SX has the following features:

Will raise your bars by 1.5" or 2.5" over stock depending on how you mount it. If you want to keep your stock handle bar height shorter riser blocks are available from your dealer.

Retains the ability to articulate your bars forward or rearward.

Adjustable handle bar deflection - simply add or remove shims between the bushings to increase or decrease the side to side deflection. Add or remove shims on the top and bottom sides of the bushings to increase or decrease the front to back deflection.

Fits 2014 Yamaha models with the Procross and Proclimb chassis and the factory aluminum riser block.

Won't fit sleds with the telescoping height adjustable steering post or with an aftermarket riser.

Availability: **We are out of stock and will have them back in stock around Feb 26**

Reference: **ISO-ACPROSX**
